

Programming Questions

18 March 2026 03:33 PM

- 1) Write a Java Program to reverse a string without using String inbuilt function.
- 2) Write a Java Program to swap two numbers without using the third variable.
- 3) Write a Java Program to count the number of Occurrence of each words in a string using HashMap.
- 4) Write a Java Program to iterate HashMap using While and advance for loop.
- 5) Write a Java Program to find whether a number is prime or not in the most efficient way?
- 6) Write a Java Program to find whether a string or number is palindrome or not
- 7) Write a Java Program for the Fibonacci series in recursion.
- 8) Write a Java Program to iterate ArrayList using for-loop, while-loop, and advance for-loop.
- 9) Write a Java Program to find the duplicate characters in a string
- 10) Write a Java Program to find the second-highest number in an array
- 11) Write a Java Program to check Armstrong number.
- 12) Write a Java Program to remove all white spaces from a string without using replace().
- 13) Given an array of integers nums and an integer target, return indices of the two numbers such that they add up to target.
- 14) Write a program that accepts comma-separated strings, sorts the strings in ascending order, and outputs the concatenated string of sorted strings.
- 15) Given a string s, return true if s is a "good" string, or false otherwise. A string s is good if all characters that appear in s have the same number of occurrences (i.e., the same frequency).
- 16) Given an array nums and a value val, remove all instances of that value in-place and return the new length of the array. Do not allocate extra space for another array. You must modify the input array in-place with O(1) extra memory.
- 17) You are given an integer array nums and an array of queries queries where queries[i] = [val, index]. For each query, add val to nums[index]. Then, return the sum of all even numbers in nums.
- 18) Given two strings s and p, find all the start indices of p's anagrams in s.
- 19) Given a string s, find the length of the longest substring without repeating characters.
- 20) Merge two sorted linked lists and return it as a new sorted list.
- 21) You are given an n x n 2D matrix representing an image, rotate the image by 90 degrees (clockwise).
- 22) Given a non-negative integer num, repeatedly add all its digits until the result has only one digit.
- 23) Given an integer, write a function to determine if it is a power of two.
- 24) Given an array nums, write a function to move all 0's to the end of it while maintaining the relative order of the non-zero elements.
- 25) Given an array nums of n integers where nums[i] is in the range [1, n], return an array of all the integers in the range [1, n] that do not appear in nums.
